# Sample Document for Retriever Agent

## Page 1: Introduction

This is a sample PDF created to test the document loader. A document loader reads files and converts their content into LangChain Document objects. Each object contains page content and metadata such as the document name and page number.

# Page 2: Retrieval

After loading, the text can be cleaned, split into smaller chunks, converted into embeddings, and stored in a vector database. The retriever can later search these chunks to find information that is relevant to a user's question.
